Stock span

4)

arr : [100 80 60 70 60 75 85]

output = [-1, 1, 1, 2, 3, 4, 6].

Agr :- Nearest greater Integer find karte hai.

arr = [100, 80, 60, 70, 60, 75, 85].

[-1 100 80 80 70 70 100]

index (0) (1) (1) (3) (4) (0)

0-(-1) = 1.

0-(-1) (1-0) (2-1) (3-1) (4-3) 5-1 6-0 → [i - index]

[1 1 1 2 1 4 6]

output.

→ Same as greater next Integer from left

→ Pehle next greater find karo.

→ Phir unka index pata karo.

→ last me ~~i - index~~ [i - index] kar do.

// Code:

```
Public static int[] stock.spam(int[] prices) {
        int n = prices.length;
        int[] spam = new int[n];

    Stack<Integer> Stock = new Stack<>();

    For(int i = 0; i<n ; i++) {
        while (!stack.isEmpty() && ~~prices [stack~~
                prices[stack.peek()] <= prices[i]) {

            Stack.pop();
        }
        if (stack.isEmpty()) {
            spam[i] = i+1;
        }else {
            spam[i] = i-stack.peek();
        }
        stack.push(i);
    }
    return spam;
  }
}
```
