

11 Q.

height = [0, 1, 0, 2, 1, 0, 1, 3, 2, 1, 2, 1]

Core formula :-

$$\text{Water} = \min(\text{left Max}, \text{Right Max}) - \text{Height}$$

- left Max Find karna hoga.
- Right Max Find karna hoga.

Example :-

left Max = 4

Right Max = 10.

$$\therefore \min(4, 10) = 4.$$

∴ right side kitni bhi badi ho
water = 4 hi rahega.

ie.

Smaller Maximum wall decide the water.

→ Time Complexity = $O(n)$

→ Space Complexity = $O(1)$.

Note:-

→ Isme hm Prefix/suffix approach
bhi use kr skte the lekin
isme space complexity $O(n)$ ho jata

Beacuse:-

→ Prefix/suffix stores both walls.

→ But in two pointer approach, the
water storage depends on smaller
wall.
